This document is intended to guide software developers in generating CDA-compliant XML patient care reports, also known as run reports, from EMS agency crews to emergency departments and other interested parties. It consists of a set of constraints on the HL7 CDA R2 model mapped to the National EMS Information System (NEMSIS) data elements.

Clinical Document Architecture (CDA) is a standard for information exchange. It is based on the HL7 Reference Information Model, but it constrains that model to a specific set of patterns. This document adds further constraints, so that it specifies not just a generic clinical document, but an Emergency Medical Services (EMS) Patient Care Report—a record of an Emergency Medical Services encounter with a patient.

Further information about CDA is available at [HL7.org](http://HL7.org).

This guide constrains the NEMSIS data set to the HL7 CDA R2 document format. NEMSIS is maintained by the NEMSIS Technical Assistance Center, a US organization funded by the National Highway Transportation Safety Administration. The NEMSIS data dictionary is available at [www.nemsis.org](http://www.nemsis.org).

## Overview

---

This implementation guide provides constraints to allow implementers to develop CDA-compliant documents that support a common set of information in the emergency medical services (EMS) domain.

This release covers the provision of information from an EMS crew to a receiving hospital or emergency department.

## Audience

---

The audience for this document is software developers and development organizations who wish to produce or receive EMS patient care reports.

Software developers should use the CDA XML schema to guide their production of EMS patient care reports, subject to the constraints documented in this guide. Mappings of NEMSIS elements to the CDA schema are included in this document, in the "NEMSIS trace" comment. Coded elements should use the vocabularies referred to in the constraints.

The CDA schema is published by Health Level 7, and is available at <http://www.hl7.org/implement/standards>.

This guide defines the information payload only. Implementers are encouraged to coordinate with one another by using the IHE framework (available at <http://www.ihe.net>) to address expected capabilities of participating systems, including security and audit considerations.

## Scope

---

The NEMSIS data specification content has been developed over the past 20 years by a variety of partners. Professional organizations contributing to the content include American Ambulance Association (AAA), American College of Emergency Physicians (ACEP), American College of Surgeons: Committee on Trauma (ACS-COT), American Heart Association (AHA), Emergency Medical Services Outcomes Project (EMSOP), International Association of Fire Chiefs (IAFC), International Association of Fire Fighters (IAFF), National Academy of Emergency Medical Dispatch (NAEMD), National Association of Emergency Medical Technicians (NAEMT), National Association of EMS Physicians (NAEMSP), National Association of State EMS Officials (NASEMSO), National EMS Management Association (NEMSMA, formerly NAEMSQP), and the National Emergency Number Association (NENA). Supporting federal partners include National Highway Traffic Safety Administration (NHTSA), Health Resources and Services Administration (HRSA), Emergency Medical Services for Children Program (EMSC), EMSC National Resource Center (NRC), EMSC National EMSC Data Analysis Resource Center (NEDARC), Centers for Disease Control and Prevention (CDC), Federal Emergency Management Administration (FEMA), and HRSA's Office of Rural Health Policy (ORHP). NEMSIS has been adopted in 54 states and territories and implemented by scores of software providers.

The NEMSIS data set supports many uses, including the transfer of patient care reports from EMS crews to emergency departments, prepopulation of hospital electronic health records, identification of trauma registry candidates, and preparation of data for submission to NEMSIS for research. The current specification is designed for the first of these use cases.

Implementers may generate the same patient care reports that they generate today and attach them under the CDA header in "level one" documents, or they may populate the structured sections as specified herein.

## Approach

---

We first transformed the NEMSIS specification into the Emergency Medical Services Domain Analysis Model (EMS DAM), initially balloted through HL7 in May of 2010 and finalized for the release in May 2011. The static part of the analysis model was then constrained to the HL7 Reference Information Model (RIM) in a Domain Information Model (DIM), balloted in January 2011, and reballoted in September 2011. After a DSTU period, this guide was balloted to Normative status in the autumn of 2013. This "level one" (attachment only, no structured data in body)

was superseded by a "level three" (structured clinical statements) guide in 2016. In the last five years, NEMESIS has collected feedback from implementers and providers and revised their specification; the current guide brings the CDA specification up to date with the NEMESIS 3.5 data set.

The guide aligns with the Consolidated CDA work by leveraging the Consolidated header. Consolidated constraints on the header are inherited but not repeated in this guide. Standard codes provided by LOINC can identify other alignments, both with the Consolidated project and with Emergency Department specification *Data Elements for Emergency Department Systems* (DEEDS).

This release is generated from UML models developed in the Open Health Tools (OHT) Model-Driven Health Tools (MDHT) project. The data specifications have been formalized into computational models expressed in UML. These models are used by automated tooling to generate this publication, plus validation tools and Java libraries for implementers.

## Units

Physical quantities use the HL7 PQ data type, in which units are expressed in the Unified Code for Units of Measure (UCUM; 2.16.840.1.113883.6.8), available at [ucum.org](http://ucum.org). Interface values that are not actual physical units are handled differently: see appendix *UCUM Unit Mapping*.

## Pertinent Negatives

For some items in this guide, negated entries have clear boundaries. A negated procedure in the Procedures Performed section clearly refers to the scope of the encounter, whereas a similar negation in the History section implies it's never been done. In other cases it can be difficult to distinguish a record that suggests absence by not recording presence from a null value.

We follow CDA guidance in using RIM attributes for observations of absence, but we also record explicit observations of presence or absence in four cases where this confusion seems likely:

- Existence Of Drug Use Indication
- Existence Of History Of Condition Or Surgery
- Existence Of Known Drug Allergy
- Existence Of Known Non Drug Allergy
- Currently On Medication

Several items also include reason observations for negatives, especially for interventions. A map of NEMESIS pertinent negatives to CDA designs can be found in the appendix *Nulls and Negative Action Values*.

## Null Value Mapping

NEMESIS contains null values not listed in HL7. "Not applicable" maps directly to "Not applicable", but "Not recorded" and "Not reporting" must be represented as the general concept "No information". These NEMESIS values may also be copied into Observation.text.

NEMESIS also contains "pertinent negatives", most of which are addressed with negation and special cases in this document. Some of the negative action values, however, are actually null values, and are recorded as "NI", no information. A mapping of negative action values is provided in the appendix *Nulls and Negative Action Values*.

## Cardinality

CDA provides several patterns for supporting cardinality. If a report is allowed to have many values for an element, that can be represented in CDA by the cardinality of the Observation.value, the Component.Observation, the Organizer.Component, the Section.Organizer, or the StructuredBody.section. We have chosen to support cardinality at the lowest level appropriate. I.e., unconstrained multiplicity will be supported at the Observation.value level. If the value is specific, e.g., to a body site, then we also support multiple Observations in the component. In this case the Component may have multiple Observations for different sites, each Observation having potentially multiple values. If there are groups of different Observations taken at different times, this would be supported with multiple Components.

Components and Observations should not be instantiated without content. I.e., a Component will always contain at least one Observation or other clinical statement, and an Observation will always contain a value (unless there is a reason for an explanatory null flavor value).

### Examples

A simple multiple valued element in an organizer or section (e.g., Skin Assessment)

- [Organizer] MAY contain zero or one [0..1] component such that it
- SHALL contain exactly one [1..1] observation such that it
- SHALL contain at least one [1..\*] value

A site-specific multiple Observation (e.g., Chest Assessment)

- [Organizer] MAY contain zero or one [0..1] component such that it
- SHALL contain at least one [1..\*] observation such that it
- SHALL contain at least one [1..\*] value

A time-specific group (e.g., Vitals)

- [Organizer] MAY contain one or more [0..\*] component such that it
- SHALL contain (1..1 or 1..\*, as appropriate) observation such that it
- SHALL contain at least one [1..\*] value

## Organization of This Guide

---

The requirements as laid out in the body of this document are subject to change per the policy on implementation guides (see the HL7 Governance and Operations Manual, [http://www.hl7.org/documentcenter/public/membership/HL7\\_Governance\\_and\\_Operations\\_Manual.pdf](http://www.hl7.org/documentcenter/public/membership/HL7_Governance_and_Operations_Manual.pdf) ).

## Templates

Templates are organized by document (see Document Templates), by section (see Section Templates), and by clinical statements (see Clinical Statement Templates). Within a section, templates are arranged hierarchically, where a more specific template is nested under the more generic template that it conforms to.

## Vocabulary and Value Sets

Vocabularies specified in this guide are derived from standard vocabularies where possible; most questions, however, are fairly specific to the EMS domain. These questions have been encoded in clinical LOINC, and the answer sets have been encoded there as well, and they are included in this document. These values can also be obtained from [LOINC.org](http://LOINC.org).

For properties bound to large value systems (e.g., ICD-10 PCS), NEMSIS provides suggested subsets at NEMSIS.org. These are not to be used to validate values (all values in the system are valid), but as suggested aids to providing a manageable user interface. All RxNorm drugs are valid, for instance, but you might wish to provide a selection of drugs commonly found on EMS vehicles for easy selection.

## Use of Templates

---

When valued in an instance, the template identifier (`templateId`) signals the imposition of a set of template-defined constraints. The value of this attribute provides a unique identifier for the templates in question.

## Originator Responsibilities

An originator can apply a `templateId` to assert conformance with a particular template.

In the most general forms of CDA exchange, an originator need not apply a `templateId` for every template that an object in an instance document conforms to. This implementation guide asserts when `templateIds` are required for conformance.

## Recipient Responsibilities

A recipient may reject an instance that does not contain a particular `templateId` (e.g., a recipient looking to receive only CCD documents can reject an instance without the appropriate `templateId`).

A recipient may process objects in an instance document that do not contain a `templateId` (e.g., a recipient can process entries that contain Observation acts within a Problems section, even if the entries do not have `templateIds`).

## Conventions Used in This Guide

---

### Conformance Requirements

Conformance statements are grouped and identified by the name of the template, along with the `templateId` and the context of the template (e.g., ClinicalDocument, section, observation), which specifies the element under constraint. If a template is a specialization of another template, its first constraint indicates the more general template. In all cases where a more specific template conforms to a more general template, asserting the more specific template also implies conformance to the more general template. An example is shown below.

#### Template name

```
[<type of template>: templateId <XXXX.XX.XXX.XXX>]
```

Description of the template will be here .....

1. Conforms to <The template name> Template (templateId: XXXX<XX>XXX>YYY).
2. **SHALL** contain [1..1] @classCode = <AAA> <code display name> (CodeSystem: 123.456.789 <XXX> Class) **STATIC** (CONF:<number>).
3. ....

#### Figure 1: Template name and "conforms to" appearance

The conformance verb keyword at the start of a constraint ( **SHALL** , **SHOULD** , **MAY** , etc.) indicates business conformance, whereas the cardinality indicator (0..1, 1..1, 1..\*, etc.) specifies the allowable occurrences within an instance. Thus, "**MAY** contain 0..1" and "**SHOULD** contain 0..1" both allow for a document to omit the particular component, but the latter is a stronger recommendation that the component be included if it is known.

The following cardinality indicators may be interpreted as follows:

- 0..1 as zero to one present
- 1..1 as one and only one present
- 2..2 as two must be present
- 1..\* as one or more present
- 0..\* as zero to many present

Value set bindings adhere to HL7 Vocabulary Working Group best practices, and include both a conformance verb ( **SHALL** , **SHOULD** , **MAY** , etc.) and an indication of **DYNAMIC** vs. **STATIC** binding. The use of **SHALL** requires that the component be valued with a member from the cited value set; however, in every case any HL7 "null" value such as other (OTH) or unknown (UNK) may be used.

Each constraint is uniquely identified (e.g., "CONF:605") by an identifier placed at or near the end of the constraint. These identifiers are not sequential as they are based on the order of creation of the constraint.

1. **SHALL** contain [1..1] component/structuredBody (CONF:4082).
  - a. This component/structuredBody **SHOULD** contain [0..1] component (CONF:4130) such that it

- a. **SHALL** contain [1..1] Reporting Parameters section (templateId: 2.16.840.1.113883.10.20.17.2.1) (CONF:4131).
- b. This component/structuredBody **SHALL** contain [1..1] component (CONF:4132) such that it
  - a. **SHALL** contain [1..1] Patient data section - NCR (templateId: 2.16.840.1.113883.10.20.17.2.5) (CONF:4133).

### Figure 2: Template-based conformance statements example

Note that most constraints in this guide do not contain the "such that" phrase, and this could in some cases give the impression that two statements, each of the form "SHALL contain exactly one . . ." are to be in conflict. This is an artifact of the modeling tool: both statements are required, and they are not in conflict.

## Keywords

The keywords SHALL, SHALL NOT, SHOULD, SHOULD NOT, MAY, and NEED NOT in this document are to be interpreted as described in the [HL7 Version 3 Publishing Facilitator's Guide](#):

- **SHALL**: an absolute requirement
- **SHALL NOT**: an absolute prohibition against inclusion
- **SHOULD/SHOULD NOT**: valid reasons to include or ignore a particular item, but must be understood and carefully weighed
- **MAY/NEED NOT**: truly optional; can be included or omitted as the author decides with no implications

## XML Examples

XML samples appear in this document in a fixed-width font. Portions of the XML content may be omitted from the content for brevity, marked by an ellipsis (...) as shown in the example below.

```
<ClinicalDocument xmlns="urn:h17-org:v3">
...
</ClinicalDocument>
```

### Figure 3: ClinicalDocument example

XPath expressions are used in the narrative and conformance requirements to identify elements because they are familiar to many XML implementers.

### Topics:

- [Patient Care Report](#)

This section contains the document level constraints for CDA documents that are compliant with this implementation guide.

## Patient Care Report

[ClinicalDocument: templateId 2.16.840.1.113883.17.3.10.2]

A report from the EMS crew to the emergency department summarizing the patient's condition and any remedial actions taken

1. **SHALL** contain exactly one [1..1] **templateId** (CONF:11388) such that it
  - a. **SHALL** contain exactly one [1..1] **@root**="2.16.840.1.113883.17.3.10.2"
  - b. **SHALL** contain exactly one [1..1] **@extension**="2022-01-01"
2. **SHALL** conform to *Consol US Realm Header2* template (templateId: 2.16.840.1.113883.10.20.22.1.1:2015-08-01)
3. **SHALL** contain exactly one [1..1] **@classCode**="DOCCLIN" (CodeSystem: 2.16.840.1.113883.5.6 HL7ActClass) (CONF:10000)
4. **SHALL** contain exactly one [1..1] **@moodCode**="EVN" *Event* (CodeSystem: 2.16.840.1.113883.5.1001 HL7ActMood) (CONF:10001)
5. **SHALL** contain at least one [1..\*] **id** (CONF:5363)

NEMESIS trace: eRecord.01 /@root should be the OID for the EMS Agency; @extension the internally assigned ID The PCR UUID can also be used as an identifier in the /@root property, no extension required.

*NEMESIS collects race and ethnicity in the one-question format (see guidance at [http://www.whitehouse.gov/omb/fedreg\\_1997standards](http://www.whitehouse.gov/omb/fedreg_1997standards)), but the HL7 RIM and, therefore, the CDA schema contain separate elements. It is necessary to populate both CDA fields based on the values selected for the NEMESIS question. Further, the CDA model includes a single race code. In order to support multiple race codes as required by OMB, we adopt a second race code entry from the HL7 SDWG namespace. All documents with a race code must populate the CDA race code; if more than one race code is recorded, then the SDWG element may also be populated. No semantic priority is implied by the element selection.*

## Vital Signs Organizer

[Organizer: templateId 2.16.840.1.1133883.17.3.10.1.28]

A collection of vital signs observations. For any observation within the organizer, if the NEMESIS value is "Refused," the value SHALL be "NI;" the string "Refused" MAY be recorded in Observation.text. Note that NEMESIS collects times at the vitals cluster level, whereas systems may record them at the observation level. No preference is indicated regarding how close individual observation timestamps must be to allow their inclusion in a cluster or how the cluster effectiveTime is determined. effectiveTime is modeled on the observations to support unanticipated uses and to conform more closely to the Consolidated CDA pattern, though the exclusion of the id property makes it impossible to assert compliance to the Consolidated template in this guide (though it remains possible to do so in an implementation).

## Nulls and Negative Action Values

This table maps NEMESIS null and negative action values to the appropriate values and structures in the HL7 CDA specification.

NEMESIS Negative Action Values	Type	Case	Solution
Unable to Complete	null	observation	Observation.value = null (NI); obs.text = "unable to complete"
Unable to Complete	neg	medication	Negate specific medication; put "unable to complete" value in Medication Not Administered Reason Observation
Unable to Complete	neg	procedure	Negate specific procedure; put "Physically unable to perform" value in Abandoned Procedure Reason Observation
Refused	null	observation (including history)	Observation.value = null (ASKU)
Refused	neg	medication given	negate specific medication; put "refused" value in MedicationNotAdministeredReason observation
Refused	neg	procedure performed	negate specific procedure; put "refused" value in ReasonProcedureNotAttempted observation

Exam finding not present (measurement)	null	observation	Observation.value = null (NAV)
Exam finding not present (presence)	neg	observation	negate specific observation value
No known drug allergies	neg	observation: negation value	Use Boolean observation ExistenceOfDrugAllergy
None reported	neg	observation: alcohol	Use Boolean observation ExistenceOfDrugUseIndication
Contraindication noted	neg	medication, procedure	negate specific procedure or medication; use related reason observation to record reason
Denied by order	neg	medication, procedure	negate specific procedure or medication; use related reason observation to record reason
Medication allergy	neg	medication	negate specific procedure or medication; use related reason observation to record reason
Medication already taken	neg	medication	negate specific procedure or medication; use related reason observation to record reason
<b>Null Values</b>			
Not Applicable	null		null: NA
Not Recorded	null		null: NI; add detail to obs.text or proc.text
Not Reporting	null		null: NI; add detail to obs.text or proc.text
<b>Proper Values</b>			
Not done	null	observation	Observation.value = null (NASK)

## UCUM Unit Mapping

This appendix provides UCUM codes for units provided by NEMSIS specifications. Note that "liters" is always uppercase "L": the character "l" signifies the numeral "one."

## NEMSIS Routes Mapped to FDA Routes of Administration

This appendix maps NEMSIS routes of administration to FDA routes. It also specifies how information implicit in NEMSIS values but not specific to routes may be modeled in the CDA structure.

Note that all codes are drawn from code system FDA Route of Administration (2.16.840.1.113883.3.26.1.1.1).
